                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 31, Application US/09765614B
Patent No. US20020102215A1
GENERAL INFORMATION:
APPLICANT: Nycomed Imaging AS
TITLE OF INVENTION: Improvements in or relating to
TITLE OF INVENTION: diagnostic/therapeutic
TITLE OF INVENTION: agents
FILE REFERENCE: REF/Klaveness/054
CURRENT PILING DATE: 2001-07-10
NUMBER OF SEQ ID NOS: 31
SEQ ID NOS: 31
SEQ ID NOS: 31
LENGTH: 13
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       FEATURE:

Eur. J. Biochem. 26:4799-4810(2002).

-!-PUNCTION: Induces a leak current in voltage-clamped dorsal root ganglion cells of rate by forming pores. Degranulates human granulocytes and has a weak hemolytic activity against human red blood cells. Has antibacterial activity against Gram-negative bacteria but is less active against Gram-positive bacteria. Has antibugal activity.
-!-SUBUNIT: Monomer and homodimer.
-!- SUBUNIT: Monomer and homodimer.
-!- TISSUE SPECIFICITY: Expressed by the venom gland.
-!- TASSUE SPECIFICITY: MW=5030.3; METHOD=MALDI; RANGE=1-45;

Biol. Word. 19:1100-1113 (2002).
-!- CATALYTIC ACTIVITY: NADH + ubiquinone = NAD(+) + ubiquinol.
-!- SIMILARITY: Belongs to the complex I subunit 3 family.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          -!- SUBDATT: F-type ATPases have 2 components, CF(1) - the catalytic core - and CF(0) - the membrane proton channel. CF(1) has five subunits: alpha(1), beta(3), gamma(1), delta(1), epsilon(1). CF(0) seems to have nine subunits: a, b, c, d, e, f, g, F6 and 8 (or A6L) (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  -!- SUBCELLULAR LOCATION: Mitochondrial.
-!- SIMILARITY: Belongs to the eukaryotic ATPase epsilon family, not
to be confused with the bacterial/chloroplast ATPase epsilon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Antimicrobial peptides for potentiating antimicrobial agents active against bacteria and fungi.

Disclosure; Page 111; 166pp; English.

The present invention describes an antimicrobial peptide (AP) for direct activity or for potentiating antimicrobial agents active against organisms such as bacteria and fungi. The AP comprises: (a) a peptide containing an amino acid sequence selected from the group consisting essentially of a first peptide template XZBZBXBXB and its derivatives selected from XZBZBXBXB, BXZXB, XBBXZXBBX and BBXZBBXZ; and (b) a second peptide template XBBXXBB, XBBXZXBB, and their derivatives selected from the group consisting of XBBXBBX, ABBXBBX, BXXBXXB, XBBZXXBB, and XBBZXXBBXXZBBX; where B = at least one positively charged amino acid; X = at least one aromatic amino acid, and where B, X and Z may be separated by one or more other amino acid, and where B, X and Z may be separated by one or more other amino acids. The peptides can be used to treat bacterial and fungal infections. The peptides also increase the antimicrobial activity of

```
The invention relates to an antimicrobial peptide composition for use against organisms such as bacteria and fungi comprising a peptide of 5-150 anino acida cornelaring a 7-13 amino acida core sequence (derived from PMP-1 and PMP-2, platelet microbiocidal protein), and retromers, truncations, extensions, combinations, fusions and their derivatives. The possible structures are fully described in the specification. Also included are (1) an antimicrobial peptide composition for direct activity or for potentiating antimicrobial agents active against organisms such as bacteria and fungi comprising a peptide of 13-74 containing an amino acid core sequence selected from truncations of the peptides described above, and retromers, extensions, combinations and fusions, and (2) antimicrobial peptides for potentiating antimicrobial activity of antimicrobial peptides for potentiating antimicrobial activity of antimicrobial peptides are useful as individual antimicrobial agents, especializally against bacteria and fungi, agents in combination with other antimicrobials, agents that enhance, potentiate or restore efficacy of conventions of leukocytes, as disinfectants or preservatives for use in foods and cosmetics and as agents to improve efficiency of molecular biology techniques. Antimicrobial peptides of prior art have generally
                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New antimicrobial peptide composition for the prevention and treatment of infections caused by organisms, such as bacteria and fungi, exhibiting
neutrophils. The peptides overall effect cellular disruption and rapid apoptosis of microbial cells. AAY57463 to AAY57557 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Antimicrobial, platelet microbiocidal protein, PMP-1, PMP-2, bacterial infection, fungal infection, fungicide, disinfectant, preservative, foods, cosmetic, multiple antibiotic resistance, rabbit,

The present invention describes an antimicrobial peptide (AP) for direct activity or for potentiating antimicrobial agents active against activity or for potentiating and fundi. The AP comprises: (a) a peptide containing an amino acid sequence selected from the group consisting essentially of a first peptide template XZBZBXBXB and its derivatives selected from XZBBZBXBXB, BXZXXB, XBBXZXBB, and BBXZBBXZ; and (b) a second peptide template XBBXXBXB, XBBXZBBX and BBXZBBXZ; and (b) a second peptide template XBBXXBBX, BXXBXB, XBBXXXBB, and consisting of KBBXBBX, XBBXXBBX, BXXBXXB, XBBXXXBB, and consisting of KBBXBBX, XBBXXBBX, BXXBXXB, XBBXXXBB, and consisting of KBBXBBX, XBBXXBBX, BXXBXXB, XBBXXXBB, and consisting of KBBXBBX, ABBXXBBX, BXXBXXB, ABBXXBB, and consisting of KBBXBBX, BXBBX, BXBXXBB, and consisting of KBBXBBX and Last one non-polar hydrophobic amino acid; Z = at least one non-polar hydrophobic amino acids. The peptides can be used to treat bacterial and fungal infections. The peptides also increase the antimicrobial activity of neutrophils. The peptides overall effect cellular disruption and rapid apoptosis of microbial cells. AAYS7463 to AAYS757 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                       ô
been considered to have undesirable toxicity, immunogenicity and short half-lives due to biodegradation. The peptides of the present invention are based upon natural antimicrobial peptides that have potent and broad spectrum activity against pathogens exhibiting multiple antibiotic resistance. They exhibit lower inherent mammalian cell toxicities and covercome problems of toxicity, immunogenicity, and shortness of duration of effectiveness due to biodegradation, retaining activity in plasma and serum. The present sequence is a rabbit PMP based antimicrobial peptide
                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Antimicrobial peptides for potentiating antimicrobial agents active against bacteria and fungi.

The invention relates to an antimicrobial peptide composition for use against organisms such as bacteria and fungi composition for use against organisms such as bacteria and fungi comprising a peptide of 5-
150 amino acids containing a 7-13 amino acid core sequence (derived from perturbations, extensions, combinations, fusions and their derivatives. The possible structures are fully described in the specification. Also included are [1] an antimicrobial peptide composition for direct activity or for potentiating antimicrobial agents active against organisms such as bacteria and fungi comprising a peptide of 13-74 containing an amino acid core sequence selected from truncations of the peptides described above, and retromers, extensions, combinations and fundions and full or and increased and containing an antimicrobial activity of antimicrobial peptides for potentiating antimicrobial activity of leukocytes against organisms such as bacteria and fungi. The antimicrobial peptides are useful as individual antimicrobial agents, specifically against bacteria and fungi, agents in combination with other antimicrobials, agents that enhance the antimicrobial agents that chance the antimicrobial functions of leukocytes, as disinfectants or preservatives for use in foods and cosmetics and as agents to improve efficiency of molecular biology techniques. Antimicrobial peptides of prior art have generally been considered to have undesirable toxicity, immunogenicity and short are based upon natural antimicrobial peptides that have potent and broad are based upon natural antimicrobial peptides that have potent and broad create based upon natural antimicrobial peptides that have potent and create based upon natural antimicrobial peptides considered to have undesirable toxicity, immunogenicity, and shortness of duration of resistance. They exhibit lower inherent mammalian cell toxicity, immunogenicity, and shortness of duration of effectiveness due to biodegradation, tretaining activity y and and considered and considered and cons

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               activity or for potentiating antimicrobial agente active against organisms such as bacteria and fungi. The AP comprises: (a) a peptide estimation and maino acid sequence selected from the group considering essentially of a first peptide template XEBENENS and its derivatives selected from XEBESENENS. BXZXEB, XEBXZXEBX and described template XEBESENSENS and selected from the group consisting of XEBESENSENS, ABEXZEBX, and (b) a second septide template XEBEXZEB, XEBEXZEBX, and (b) as second septide template XEBEXZEBX, BXEBZXEB, XEBEZXEB, where B at least one positively charged amino acid; X at least one non-polar hydrophobic amino acid; Z at least one aromatic amino acids and where B, X and Z amay be separated by one or more other amino acids. The peptides can be used to treat bacterial and fungal infections. The peptides also increase the antimicrobial activity of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes an antimicrobial peptide (AP) for direct
serum. The present sequence is a rabbit PMP based antimicrobial peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  neutrophils. The peptides overall effect cellular disruption and rapid apoptosis of microbial cells. AAY57463 to AAY57557 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Antimicrobial peptides for potentiating antimicrobial agents active
                                                                                                                                                                                                                                                                                                                                                                                                        Antimicrobial; metapeptide; PMP-2; platelet microbicidal protein; antibiotic; infection; fungal; bacterial; neutrophil; apoptosis.

The present invention describes an antimicrobial peptide (AP) for direct activity or for potentiating antimicrobial agents active against organisms such as bacteria and fungi. The AP comprises: (a) a peptide containing an amino acid sequence selected from the group consisting essentially of a first peptide template XZBZBXBXB and its derivatives selected from XZBBZBXBXB, BXXXXB, XBBXXXBX and EBXZBXZ, and (b) a second peptide template XBXX and their derivatives selected from the group consisting of XBBXBBX, XBBXXBBX, BXXBXXB, XBBXXBBX, and consisting of XBBXBBX, XBBXXBB, BXXBXXB, BXBBXXBB, and CABX ABBXXBBX, WBBXXBBX, BXXBXXB, ABBXXBBX, and consisting of XBBZBXBBX, XBBXXBB, BXXBXXB, ABBZXXBB, and consisting of XBBZBXBBX, ABBXXBBX, BXXBXXB, ABBZXXBB, and consisting of XBBZBXBBX, ABBXXBBX, BXXBXXB, BXXBXB, and consisting on on-polar hydropholic amino acids. The peptides can be used to treat bacterial and fungal infections. The peptides also increase the antimicrobial activity of neutrophils. The peptides overall effect cellular disruption and rapid apoptosis of microbial cells. AAY57463 to AAY5757 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Antimicrobial peptides for potentiating antimicrobial agents active

```
The invention relates to an antimicrobial peptide composition for use against organisms such as bacteria and fungi comprising a peptide of 5-
150 amino acide containing a 7-13 amino acid core sequence (derived from pwp-1 and pwp-2, platelet microbical protein), and recromers, runcations, extensions, combinations, fusions and their derivatives. The possible structures are fully described in the specification. Also included are (1) an antimicrobial peptide composition for direct activity or for potentiating antimicrobial agents active against organisms such as bacteria and fungi comprising a peptide of 13.74 containing an amino acid core sequence selected from truncations of the peptides described above, and retromers, extensions, combinations and fusions; and (2) actimicrobial peptides for potentiating antimicrobial activity of antimicrobial peptides are useful as individual antimicrobial agents, specifically against bacteria and fungi, agents in combination with other specifically against bacteria that enhance the antimicrobial agents of conventional antimicrobials, agents that enhance the antimicrobial conventional antimicrobials, agents to improve efficiency of conventional antimicrobials, agents to improve efficiency of functions of leukocytes, as disinfectants or preservatives for use in thoolay techniques. Antimicrobial peptides of prior art have generally been considered to have undesirable toxicity, immunogenicity and short of biology techniques. Antimicrobial peptides of prior art have generally become archivity against pathogens exhibiting multiple antibiotic conservations are based upon natural antimicrobial peptides with the present and broad spectrum activity against pathogens exhibiting multiple antibiotic or resistance. They exhibit lower inherent mammaliance of diviration and an advance of the sension are an advanced or the sension of the sension are an advanced or the sension are an advanced or the sension are sensions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New antimicrobial peptide composition for the prevention and treatment of infections caused by organisms, such as bacteria and fungi, exhibiting multiple antibiotic resistance.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    overcome problems of toxicity, immunogenicity, and shortness of duration of effectiveness due to biodegradation, retaining activity in plasma and serum. The present sequence is a rabbit PMP based antimicrobial peptide
                                                                     Antimicrobial; platelet microbiocidal protein; PMP-1; PMP-2; bacterial infection; fungal infection; fungicide; disinfectant; preservative; foods; cosmetic; multiple antibiotic resistance; rabbit;
                      Rabbit platelet microbicidal protein, PMP-2, based peptide #35
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 67.4%; Score 64; DB 5; 76.5%; Pred. The invention relates to an antimicrobial peptide composition for use against organisms such as bacteria and fungi comprising a peptide of 5-150 anino acids containing a 7-13 amino acid core sequence (derived from PMP-1 and PMP-2, platelet microbiocidal protein), and retromers, truncations, extensions, combinations, fusions and their derivatives. The possible structures are fully described in the specification. Also included are (1) an antimicrobial peptide composition for direct activity or for potentiating antimicrobial agents active against organisms such as bacteria and fungi comprising a peptide of 13-74 containing an amino acid core sequence selected from truncations of the peptides described above,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           and retromers, extensions, combinations and fusions; and (2) and retromers, extensions, combinations and fusions; and (2) antimicrobial peptides for potentiating antimicrobial activity of leukocytes against organisms such as bacteria and fungi. The antimicrobials peptides are useful as individual antimicrobial agents, specifically against bacteria and fungi, agents in combination with other antimicrobials, agents that enhance, potentiate or restore efficacy of conventional antimicrobials, agents that enhance the antimicrobial functions of leukocytes, as disinfectants or preservatives for use in foods and cosmetics and as agents to improve efficiency of molecular biology techniques. Antimicrobial peptides of prior art have generally half-lives due to biodegradation. The peptides of the present invention are based upon natural antimicrobial peptides that have potent and broad appetrum activity against pathogens exhibiting multiple antibiotic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New antimicrobial peptide composition for the prevention and treatment of infections caused by organisms, such as bacteria and fungi, exhibiting multiple antibiotic resistance.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 resistance. They exhibit lower inherent mammalian cell toxicities and overcome problems of toxicity, immunogenicity, and shortness of duration of effectiveness due to biodegradenion, retaining activity in plasma and serum. The present sequence is a rabbit PMP based antimicrobial peptide
                                                                                                                                                                                    Antimicrobial; platelet microbiocidal protein; PMP-1; PMP-2; bacterial infection; fungal infection; fungicide; disinfectant; preservative; foods; cosmetic; multiple antibiotic resistance; rabbit;
                                                                                                                                       Rabbit platelet microbicidal protein, PMP-2, based peptide #37
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match 67.4%; Score 64; DB 5; Length 19; Best Local Similarity 76.5%; Pred. activity or for potentiating antimicrobial agents active against organisms such as bacteria and fungi. The AP comprises: (a) a peptide containing an amino acid sequence selected from the group consisting essentially of a first peptide template XZBZRBXB and its derivatives selected from XZBBZRBXB. BXZXB. XBBXZXBBX and their derivatives selected from the group consisting of XBBXZBBXB. BXZXB. XBBXZXBBX and BBXZBBXZ; and (b) as second opeptide template XBBXZXBB. XBBXZXBBX. ABBXZXBBX. BXZXBBXXBBX. and (b) XBBZXXBBXZBBX; where B at least one positively charged amino acid; and where B, X and Z may be separated by one or more other amino acids. The peptides can be used to treat bacterial and fungal infections. The peptides overall effect cellular disruption and rapid apportosis of microbial cells. AAY57463 to AAY57557 represent sequences

The invention relates to an antimicrobial peptide composition for use against organisms such as bacteria and fungi comprising a peptide of 5-150 amino acide corresions containing a 7-13 amino acide core sequence (derived from PWP-1 and PMP-2, platelet microbial protein), and retromers, truncations, extensions, combinations, fusions and their derivatives. The possible structures are fully described in the specification. Also included are (1) an antimicrobial agents active against organisms such as active against organisms such as attimicrobial and peptide composition for direct activity or or for potentiating an peptide of 13-7 containing an amino acid core sequence selected from truncations of the peptides described above, and retromers, extensions, combinations and fusions; and (2) antimicrobial peptides for potentiating antimicrobial activity of leukocytes against organisms such as bacteria and fungi. The antimicrobial peptides are useful as individual antimicrobial activity of conventional antimicrobials, agents that enhance, potentiate or restore efficacy of conventions of leukocytes, as disinfectants or preservatives for use in foods and cosmetics and as agents to improve efficiency of molecular biology techniques. Antimicrobial peptides of prior art have generally been considered to have undesirable toxicity, immunogenicity and short half-lives due to biodegradation. The peptides of the present invention are based upon natural antimicrobial peptides that have potent and broad are based upon natural antimicrobial peptides that have potent and broad are based upon natural antimicrobial peptides that have potent and broad are based upon natural antimicrobial peptides that have potent and broad are based upon natural antimicrobial peptides of prior art have generally appetite and as agents that manimum activity against pathogens exhibiting multiple antibiotic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    resistance. They exhibit lower inherent mammalian cell toxicities and overcome problems of toxicity, immunogenicity, and shortness of duration of effectiveness due to biodegradation, retaining activity in plasma and serum. The present sequence is a rabbit PMP based antimicrobial peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New antimicrobial peptide composition for the prevention and treatment infections caused by organisms, such as bacteria and fungi, exhibiting

The present invention describes an antimicrobial peptide (AP) for direct activity or for potentiating antimicrobial agents active against croganisms such as bacteria and fungi. The AP comprises: (a) a peptide containing an amino acid sequence selected from the group consisting essentially of a first peptide template XZBZBXENE and its derivatives selected from XZBBZRARE, BXZXZB, XBBXZXBBX and BMZZBBXZ, and (b) a second peptide template XBBXXB, BXXXXBX, XBBXZBBX, and (b) group consisting of XBBXBBX, XBBXXBBX, BXXBXXB, XBBZXBB, and XBBXXBBBX, where B = at least one positively charged amino acid, x = at least one positively charged amino acid, x = at least one speared by one or more other amino acid, and where B, X and Z may be separated by one or more other camino acids. The peptides can be used to treat bacterial and fungal nections. The peptides also increase the antimicrobial activity of neutrophils. The peptides also increase the antimicrobial activity of apoptosis of microbial effect cellular disruption and rapid apoptosis of microbial activity of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ઠે
                                                                                                                                                                                                                                                                                                                                                                          The invertion features to an antimuticibility comprising a peptide of 5-
150 amino acids containing a 7-13 amino acid core sequence (derived from
PMP-1 and PMP-2. platelet microbiocidal protein), and retromers,
truncations, extensions, combinations, fusions and their derivatives. The
possible structures are fully described in the specification. Also
included are (1) an antimicrobial peptide composition for direct activity
or for potentiating antimicrobial peptide composition for direct activity
or for potentiating antimicrobial agents active against organisms such as
bacteria and fungi comprising a peptide of 13-74 containing an amino acid
core sequence selected from truncations of the peptides described above,
and retromers, extensions, combinations of the peptides described above,
antimicrobial peptides for potentiating antimicrobial activity of
antimicrobial peptides are useful as individual antimicrobial agents
conventional antimicrobials, agents that enhance the antimicrobial agents
conventional antimicrobials, agents that enhance the antimicrobial
conventions of leukocytes, as disinfectants or preservatives for use in
conventional antimicrobial peptides of prior art have generally
conventions and as agents to improve efficiency of molecular
biology techniques. Antimicrobial peptides of prior art have generally
check onsidered to have undesirable toxicity, immunogenicity and short
half-lives due to biodegradation. The peptides that have potent and broad
spectrum activity against pathogens exhibiting multiple antibictic
cresistence. They exhibit lower inherent mammallan cell toxicities and
cresistence are inherent mammallan cell toxicities
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                       New antimicrobial peptide composition for the prevention and treatment of infections caused by organisms, such as bacteria and fungi, exhibiting multiple antibiotic resistance.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                overcome problems of toxicity, immunogenicity, and shortness of duration of effectiveness due to biodegradation, retaining activity in plasma and serum. The present sequence is a rabbit PMP based antimicrobial peptide
 preservative; foods; cosmetic; multiple antibiotic resistance; rabbit.
                                                                                                                                                                                                                                                                                                                                                                    invention relates to an antimicrobial peptide composition for use
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
